

## Broadband First ADSL2+ X2

Broadband First are now offering true bonded ADSL2+ connectivity to deliver unmatched download/upload speed and value for money on an ADSL service.

### Performance – Up to 48Mbps down/ 5Mbps up

Broadband First can now deliver the full potential of ADSL2+ connectivity over 2 bonded lines. Subject to line conditions, the potential of maximum speeds of 48Mbps downstream and 5Mbps upstream being achievable for the first time over a pair of BT lines.

There are no caps, limits or throttling and because the service is delivered over a state-of-the-art dedicated network there are no more 50:1 and 20:1 contention ratios, just consistently high performance, even at busy times.

### Resilience

By combining connectivity over 2 physical lines, Broadband First X2 provides much needed peace of mind that your internet connectivity will be there when you need it. If either line should suffer an outage, traffic will continue to flow over the remaining line unaffected, with the same IP numbers and without the need for complex networking technology to maintain connectivity. This means that you can carry on working unaffected while the fault is resolved.

### Flexibility

Broadband First X2, with up to 48Mbps down and 5Mbps up, offers you a whole range of applications that have until now been difficult or impossible to offer on a simple ADSL service. The high download speed will support a host of high demand applications as well as a high number of users, while the high upload offers new opportunities for remote access, VOIP, hosting and video applications.

### More

If you would like further information on the availability of this service for you or your end users please submit a telephone number for us to check. Pricing for this service is available on a separate document.
